ABSTRACT

This report describes machine-independent, table-handling routines and tables applied within the computer-aided construction specification preparation system known as EDITSPEC. The table design concepts and application programs are presented, and the tables used by the system are defined.

FOREWORD

This investigation was performed for the Directorate of Military Construction, Office of the Chief of Engineers (OCE), under Project 4A762731AT41, "Design, Construction, and Operation and Maintenance Technology for Military Facilities"; Task T1, "Development of Automated Procedures for Military Construction"; Work Unit 009, "Computer-Based Specifications." The applicable QCR is 1.10.001. The OCE Technical Monitor was William Darnell. The table-handling programs were written by Jayant Krishnaswany.

The study was performed by the Management System Branch (Dr. O. E. Rood, Jr., Chief), Facility Acquisition and Construction Division (Mr. E. A. Lotz, Chief), U.S. Army Construction Engineering Research Laboratory (CERL).

COL L. J. Circeo, Jr., is Commander and Director of CERL and Dr. L. R. Shaffer is Technical Director.

REVISION LIST

<u>Revision Number</u>	<u>Date Revised</u>	<u>Reason for Revisions</u>	<u>Pages Revised</u>
----------------------------	-------------------------	---------------------------------	--------------------------

1 DESIGN CONCEPTS

Table Definition

A direct access data set or file is a group of physical records (see Figure 1). A data set can be divided into smaller entities called tables. A table can be defined as a named subset of a data set, or file, composed of unshared physical records. Each table contains a variable number of complete physical records, as shown in Figure 2. Physical records are dynamically assigned to tables on an as-needed basis and are not necessarily contiguous (see Figure 2). Each table may be given a unique four-word name for reference purposes.

Table Organization

Each table is divided into two logical units: the header records, and the data records (see Figure 3). Header records serve as a functional index or directory which can be searched rapidly to locate a pointer to the correct data record. Data records contain the basic information that is stored within a table. Information about each table is kept in a common area of the user's program.

There are two general types of tables in the EDITSPEC system: (1) system tables that contain information required by all users, and (2) document tables that contain information required by only a small portion of the users. Document tables contain information related to one section of contiguous text stored within the system.

Header Records Logical Unit

Header Sets

The header record logical unit is divided into header sets (see Figure 4), which minimize data retrieval time. Each header set has one super-header record and from one to six header records.

When the initial header set (known as the level 1 header set) contains six header records and a seventh must be added, a new header set (known as the level 2 header set) will be added above the first. This process minimizes access time and is performed automatically by EDIPEC.

The higher-numbered header set contains a list of the first item for each header record in the lower header set. This higher-numbered header set also keeps a list of the associated record of the lower header set.

The highest header set is searched for the key item required. The binary search program requires that an average of three logical records be read before a pointer to the next lower header set is located.

The search program must move to the second highest header set and progress downward to the first header set. Each search of a header set requires that one logical record be read that there be a binary search of that record.

For example, assume that the data related to key item 125 is required (see Figure 5). The search program would read R1 in header set No. 3 and determine that key 110 is the closest key given below the required key of 125. The program would read R3 from header set No. 2 and determine that key item 110 is the closest key given below the required key of 125. The program would move to R4 in header set No. 1 and locate key 125. In the example, the data related to key 125 is located in R10.

Header Records

Each header record contains either 241 or 243 standard units or words (see Figure 6). The first 240 standard units (SU) of the header are subdivided into lists in the following order:

1. Primary key lists
2. Secondary key lists
3. Data record I.D. list

The primary and secondary key lists may each be several words long. The list of all of the first words in a key is given before the list of the second words, etc. Secondary keys are only stored in header records at level 1. For example, assume that the following two items are in the table in one header record.

primary keys:	A1 A2 A3	B1 B2 B3
secondary key 1:	A11 A12	B11 B12
secondary key 2:	A21 A22	B21 B22
data record I.D.:	AIR	BIR

The header record would appear as shown in Figure 6. The 241st SU records the number of keys within the header record. The 242nd SU contains the preceding record ID (used only for NO - POINT tables). The 243rd SU contains the following record I.D. (used only for NO - POINT tables).

Super-Header Record

Each super-header record contains either 9 or 11 standard units or words defined as:

<u>Standard Unit</u>	<u>Definition</u>
1	Header set level number
2	Number of standard units in the primary key of each data record
3	Maximum number of entries that can be placed into one level 1 header set header record (an entry is a primary key, associated secondary keys, and a data record I.D.)
4	Position of start of data record I.D. list in header set No. 1
5	Record I.D. for the super header in header set No. 1
6	Record I.D. for the last header record in header set No. 1
7	(Table storage mode + (number of regular header records))
8	First word of the largest key value in the table (table control word No. 1)
9	Optional word for table-specific applications (table control word No. 2)
10	Preceding record I.D. (used only for NO-POINT tables)
11	Following record I.D. (used only for NO-POINT tables)

Data Records Logical Unit

The data records within a table may be a mixture of both fixed-length and variable-length logical records. The organization of the data records varies from table to table and is defined for each.

Table Common Areas

Each table has a five-word common area defined as follows:

1. The portion of the file name that is unique to this table
 - a. First word for system tables
 - b. Last word for document tables
2. The record I.D. for the highest header set super header
3. The number of SU's in the primary key
4. The number of SU's in all secondary keys
5. The table storage mode.

2 APPLICATION PROGRAM DESCRIPTION

To implement the table handler, the user will apply the application program in all computer coding. The application of each routine is given in the remaining sections of this chapter. All parameters are of type INTEGER. The parameters are defined as follows:

ITEM	DESCRIPTION
IHDR	is a 243-SU array defined by the table-handler programs. It contains the header record in header set No. 1 that stores the data record I.D. for the required key entry.
KEY	is a variable length array created by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.
COMMON	is the name of the five-word array which defines the information for the table in question and is given as input by the user.
IHDID	is the record I.D. of the header record in IHDR that is returned by the program.
LOC	is the SU in array IHDR that contains or the record I.D. of the key item data record.
IDREC	is the data record I.D. associated with the KEY item.
IFLAG	is the SU in array IHDR that contains the first word of the KEY item.

Before calling any table-handling routine, the following variables in blank COMMON must be defined (except as noted):

FILNM (4)	is a four-word array used to define the table (file) name (exceptions: TBLCS, TBNXT, TBBK, TBFST, TBLST)
NDS	is a word used to define the data set number on which the table resides (exceptions: none).

ADD KEY WITH USER ID
TBADF

PURPOSE

This table handling routine adds one key item and the current user I.D. into the table header of a system format table.

GENERAL FORM

CALL TBADF (COMMON, KEY, IHDR, IH DID, LOC)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

KEY

is a variable-length array which is declared by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.

IHDR

is a 243-SU array which is created by the table-handler programs. It contains the header record in header set No. 1 that stores the data record I.D. for the required key entry.

IHDID

is the record I.D. of the header record in IHDR that is returned by the program

ADD KEY WITH USER ID
TBADF

LOC

is the SU in array IHDR
that contains the
record I.D. of the
key item data record.

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five word array in common	no default; field required.
2. KEY	a. a one word format I.D. to be added b. if zero, the routine will assign a value for KEY	no default; field required.
3. IHDR	name of a 243-word array for the header record storage	no default; field required.
4. IH DID	name of a one-word variable for storing the record I.D. of the header record in IHDR	no default; field required.
5. LOC	a. SU where the record I.D. of the data record should be placed by the user. b. If returned negative, the KEY already exists in the table.	no default; field required.

ADD KEY WITH USER ID
TBADF

SPECIAL NOTES

All variables must be integers.

EXECUTION PROCEDURES

The user inputs values for COMMON & KEY. This routine adds KEY as a new entry to the table header for a system format table. The current user I.D. located in common area USID is added as the only secondary key. IHDR, IH DID, and LOC are returned by this program. If the key is added successfully, the user should call DKPUT for the data record and enter the record I.D. in array location IHDR (LOC); then, call DKPUT (IH DID, IHDR, 1, 240 *NCU) to store the header record.

ADD KEY WITH RECORD ID
TBADR

PURPOSE

This table-handling routine adds one key and its associated data record I.D. into the table header.

GENERAL FORM

CALL TBADR (COMMON, KEY, IDREC)

where COMMON

is the name of the five, word array defining the information for the table in question and given as input by the user.

KEY

is a variable-length array created by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.

IDREC

is the data record I.D. associated with the KEY item.

ADD KEY WITH RECORD ID
TBADR

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.
2. KEY	name of a variable word array defining the KEY	no default; field required.
3. IDREC		no default; field required.

SPECIAL NOTES

This routine assumes that KEY does not already exist in the table. All variables must be integers.

EXECUTION PROCEDURES

This routine adds one key and its data record I.D. to the header. If the key already exists, the routine will cause a data-handler error and a subsequent system abort.

ADD KEY
TBADS

PURPOSE

This table handling routine adds one key item into the table header.

GENERAL FORM

CALL TBADS (COMMON, KEY, IHDR, IH DID, LOC)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

KEY

is a variable-length array which is created by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.

IHDR

is a 243-SU array which is created by the table-handler programs. It contains the header record in header set No. 1 that stores the data record I.D. for the required key entry.

ADD KEY
TBADS

IHDID

is the record I.D. of
the header record in IHDID
that is returned by the
program.

LOC

is the SU in array
IHDID that contains or
points to the record I.D.
of the key item data
record.

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.
2. KEY	name of a variable word array defining the KEY	no default; field required.
3. IHDR	name of a 243-word array for the header record storage	no default; field required.
4. IHDID	name of a one-word variable for storing the record I.D. of the header record in IHDR	no default; field required.
5. LOC	a. position of the SU for storing the data record I.D. A positive value for LOC indicates a successful completion.	no default; field required.

ADD KEY
TBADS

b. negative of the
SU of the record I.D.
location when KEY
already exists.

SPECIAL NOTES

All variables must be integers.

EXECUTION PROCEDURE

The routine will add one KEY and return IHDR, IH DID, and LOC. If the KEY already exists, LOC will be set to the negative location of the record I.D.

OBTAINT PREVIOUS KEY
TBBK

PURPOSE

This table-handling routine will move to the previous KEY item.

GENERAL FORM

CALL TBBK (COMMON, IHDR, IFLAG, LOC)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

IHDR

is a 243-SU array which is created by the table-handler programs. It contains the header record in header set No. 1 that stores the data record I.D. for the required key entry.

IFLAG

is the SU in array IHDR that contains the first word of the KEY item.

LOC

is the SU in array IHDR that contains the record I.D. of the key item data record.

· OBTAIN PREVIOUS KEY
TBBK

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.
2. IHDR	name of a 243-word array for the header record storage	no default; field required
3. IFLAG	a. name of the SU containing the first word of KEY.	no default; field required.
4. LOC	a. position of the SU which contains the key item data record I.D. A positive value for LOC indicates a successful completion. b. LOC is set to zero when the current KEY is the first KEY in the table.	no default; field required.

SPECIAL NOTES

This routine should be called only after a previous call to TBLCS. TBLCS defines IHDR, IFLAG, and LOC for a current KEY. All variables must be integers.

OBTAİN PREVIOUS KEY
TBBK

EXECUTION PROCEDURES

The routine will back up to the previous (next smaller) KEY entry. If the current KEY is the first (smallest) entry in the table, LOC is set to zero.

CHANGE KEY IF USER CREATOR
TBCHF

PURPOSE

This table-handling routine locates the KEY record I.D. and checks to insure that the user is the creator of the KEY.

GENERAL FORM

CALL TBCHF (COMMON KEY IDREC LOC)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

KEY

is a variable-length array which is created by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.

IDREC

is the record I.D. of the data identified by the KEY item.

LOC

is the SU in array IHDR that contains the record I.D. of the key item data record.

CHANGE KEY IF USER CREATOR
TBCHF

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.
2. KEY	name of a variable word array defining the KEY	no default; field required.
3. IDREC	name of the record I.D. of key item data record	no default; field required.
4. LOC	a. position of the SU containing the key item data record I.D. A positive value for LOC indicates a successful completion. b. a zero indicates the KEY was not found c. a negative indicates the user is not the creator of the KEY.	no default; field required.

SPECIAL NOTES

All variables must be integers.

CHANGE KEY IF USER CREATOR
TBCHF

EXECUTION PROCEDURES

The routine locates the KEY and checks to see if the user is the creator. If the user is the creator, LOC is set to one. If the KEY does not exist, LOC is set to zero. If the user is not the creator, LOC is set to -1.

DELETE KEY IF USER CREATOR
TBDLF

PURPOSE

This table-handling routine deletes the KEY from the header if the user is the creator of the KEY.

GENERAL FORM

CALL TBDLF (COMMON, KEY, IDREC, LOC)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

KEY

is a variable-length array created by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.

IDREC

is the record I.D. of the data identified by the KEY item.

LOC

is the SU in array IHDR that contains the record I.D. of the key item data record.

DELETE KEY IF USER CREATOR
TBDLF

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.
2. KEY	name of a variable-word array defining the KEY	no default; field required.
3. IDREC	name of the record I.D. of the key item data record	no default; field required.
4. LOC	a. position of the SU containing the key item data record I.D. A positive value for LOC indicates a successful completion. b. LOC is set to zero if KEY does not exist. c. LOC is set to -1 if user is not the creator of key	no default; field required.

SPECIAL NOTES

All variables must be integers.

DELETE KEY IF USER CREATOR
TBDLF

EXECUTION PROCEDURES

The routine locates the KEY and checks to insure that the user is the creator. If the user is the creator, the KEY entries are deleted from the header and LOC is set to 1. If the KEY is not found, LOC is set to 0. If the user is not the creator, LOC is set to -1.

DELETE KEY
TBDLS

PURPOSE

This table-handling routine deletes a KEY from the table header.

GENERAL FORM

CALL TBDLS (COMMON, KEY, IDREC)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

KEY

is a variable-length array which is created by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.

IDREC

is the record I.D. of the data identified by the KEY item.

DELETE KEY
TBDLS

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.
2. KEY	name of a variable-word array defining the KEY	no default; field required.
3. IDREC	a. name of the record I.D. of key item data record b. IDREC set to zero if KEY is not found.	no default; field required.

SPECIAL NOTES

All variables must be integers.

EXECUTION PROCEDURE

The routine will locate KEY and delete it from the table header. If KEY is not found, IDREC will be set to zero.

LOCATE KEY
TBLCS

PURPOSE

This table-handling routine locates one KEY item.

GENERAL FORM

CALL TBLCS (COMMON, KEY, IHDR, IFLAG, LOC)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

KEY

is a variable-length array created by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.

IHDR

is a 243-SU array which is created by the table-handler programs. It contains the header record in header set No. 1 that stores the data record I.D. for the required key entry.

IFLAG

is the SU in array IHDR that contains the first word of the KEY item.

LOCATE KEY
TBLCS

LOC

is the SU in array IHDR
that contains
the record I.D. of the key
item data record.

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.
2. KEY	name of a variable-word array defining the KEY	no default; field required.
3. IHDR	name of a 243-word array for the header record storage	no default; field required.
4. IFLAG	a. position of the first word of KEY. b. The negative of the position of the first word of the next larger entry when KEY is not in the table, and is not larger than the largest entry in the table. c. The negative of the position of the first word of the largest entry in the table when KEY is larger than the largest entry. d. -1 when the table is empty.	no default; field required.

LOCATE KEY
TBLC5

5. LOC

- a. Position of the sub containing the key item data record I.D. A positive value for LOC indicates a successful completion.
b. -1 when the table is empty.
-

SPECIAL NOTES

All variables must be integers.

EXECUTION PROCEDURES

The routine locates KEY and defines IHDR, IFLAG, and LOC. If the table is empty, IFLAG and LOC are set to -1. If the KEY is not found, IFLAG is set to the negative of the location of the nearest KEY entry larger than the KEY to be located (or if no such KEY entry exists, then it sets IFLAG to the negative of the location of the largest KEY entry in the table).

OBTAI N NEXT KEY
TBNXT

PURPOSE

This table-handling routine will move the next larger KEY item.

GENERAL FORM

CALL TBNXT (COMMON IHDR IFLAG LOC)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

IHDR

is a 243-SU array defined by the table-handler programs. It contains the header record in header set No. 1 that stores the data record I.D. for the required entry.

IFLAG

is the SU in array IHDR that contains the first word of the KEY item.

LOC

is the SU in array IHDR that contains the record I.D. of the key item data record.

OBTAİN NEXT KEY
TBNXT

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.
2. IHDR	name of a 243-word array for the header record storage	no default; field required.
3. IFLAG	position of the SU containing the first word of KEY.	no default; field required.
4. LOC	a. position of the SU containing the key item data record I.D. A positive value for LOC indicates a successful completion. b. LOC is set to zero when the current KEY is the last KEY in the table.	no default; field required.

SPECIAL NOTES

This routine should be called only after a previous call to TBLCS. TBLCS defines IHDR IFLAG and LOC for a current KEY. All variables must be integers.

OBTAI NEX T KEY
TBNXT

EXECUTION PROCEDURES

The routine will move forward to the next larger KEY entry. If the current KEY is the last (largest) entry in the table, LOC is set to zero.

OBTAI NEW KEY
TBNAL

PURPOSE

This table-handling routine will provide an unused KEY I.D. for the table header.

GENERAL FORM

CALL TBNAL (COMMON, KEY)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

KEY

is a variable-length array created by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.

OBTAI NEW KEY
TBNAL

2. KEY name of a variable-word array defining the KEY no default; field required.

SPECIAL NOTES

All variables must be integers.

EXECUTION PROCEDURE

The routine will return the next available KEY I.D. for use by the programmer.

OBTAINT FIRST KEY
TBFST

PURPOSE

This table-handling routine will locate the first KEY in the table.

GENERAL FORM

CALL TBFST (COMMON, IKEY, IHDR, IFLAG, LOC)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

IKEY

is a variable-length array created by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.

IHDR

is a 243-SU array created by the table-handler programs. It contains the header record in header set No. 1 that stores the data record I.D. for the required key entry.

IFLAG

is the SU in array IHDR that contains the first word of the KEY item.

LOC

is the SU in array IHDR that contains the record I.D. of the key item data record.

OBTAINT FIRST KEY
TBFST

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.
2. IHDR	name of a 243-word array for the header record storage.	no default; field required.
3. IFLAG	a. position of the SU containing the first word of KEY. b. negative when table is empty.	no default; field required.
4. LOC	a. position of the SU containing the key item data record I.D. A positive value for LOC indicates a successful completion. b. negative when table is empty.	no default; field required.

SPECIAL NOTES

All variables must be integers.

EXECUTION PROCEDURES

The routine will locate the first KEY In the table. If the table is empty, IFLAG and LOC will be set to -1.

OBTAINT LAST KEY
TBLST

PURPOSE

This table-handling routine will locate the last KEY in the table.

GENERAL FORM

CALL TBLST (COMMON, IKEY, IHDR, IFLAG, LOC)

where COMMON

is the name of the five-word array defining the information for the table in question and given as input by the user.

IKEY

is a variable-length array created by the user. It contains the primary key definition. The length of this array must conform to the standard primary key length defined for the table being accessed.

IHDR

is a 243-SU array created by the table-handler programs. It contains the header record in header set No. 1 that stores the data record I.D. for the required key entry.

IFLAG

is the SU in array IHDR that contains the first word of the KEY item.

LOC

is the SU in array IHDR that contains the record I.D. of the key item data record.

OBTAİN LAST KEY
TBLST

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	name of a five-word array in common	no default; field required.
2. IHDR	name of a 243-word array for the header record storage	no default; field required.
3. IFLAG	a. position of the SU containing the first word of KEY b. negative when table is empty	no default; field required.
4. LOC	a. position of the SU containing the key item data record I.D. A positive value for LOC indicates a successful completion. b. negative when table is empty.	no default; field required.

SPECIAL NOTES

All variables must be integers.

EXECUTION PROCEDURES

The routine will locate the last KEY in the table. If the table is empty, IFLAG and LOC will be set to -1.

PURPOSE

This table-handling routine will delete the super header and all associated header records and replace the super header record located in the same table. The new header set must reside in the same table.

GENERAL FORM

CALL TBSHS (COMMON, NSHRI)

where COMMON is the name of the five word array defining the information for the table in question and given as input by the user.

NSHRI is the new super header record id.

FIELD OPTIONS

FIELD	OPTIONS	DEFAULT
1. COMMON	Name of a five-word array in common	No default field required.
2. NSHRI	a. new super header record id for header set switching b. zero (0) for header set and one data record deletion.	no default; field required

**DELETE /RSWITCH HEADERSETS
TBSHS**

SPECIAL NOTES

The new table-header sets must reside in this table. Only the data record given in the header will be deleted from the table.

EXECUTION PROCEDURES

The routine will save the record id of the super header and then delete data records if NSHRF is zero. The header set will be removed and replaced if NSHRI is not zero.

3 TABLE DOCUMENTATION

A new table will be documented and entered into the appendices in five sections:

1. A general description of the table's purpose will be placed in the table purpose list.
2. A modified form of DA Form 3493-R will be applied to conform to Army regulations.
3. Record diagrams will be drawn to illustrate the table's records.
4. A list of data values will be given, if appropriate.
5. A list of all subroutines applying to the table will be kept.

General Description

This description should be short -- approximately one paragraph of three simple sentences.

DA Form 3493-R

One DA Form 3493-R should be completed for each record type in the table. The following instructions should be followed in detail:

1. Page No. Enter the page name that applies to the record layout.
2. No. of Pages. Enter the total number of pages comprising the record layout.
3. Date. Enter the date that the record layout is approved for implementation.
4. Systems I.D. Leave blank.
5. Record Length. Enter the number of standard units (words) contained in the record being described. If the length varies, indicate minimum-maximum parameter or record length, or enter the word "variable".
6. Prepared By. Enter the name of the analyst/programmer responsible for developing the record layout.

7. Card, Disk, Tape, Other. Check the disk block which describes the type of record being illustrated.
8. Rec Per Blk. Leave blank.
9. Remarks. Leave blank.
10. Relative Position. Enter the position within the record for the information element being described (i.e., sequentially assigned field number).
11. Identification of Element (Field) and Abbreviation. Enter the number and name assigned for the information element being identified. Place the maximum number of standard units (words) required for the element in the abbreviation column.
12. Length/Class. Enter the number of characters or standard units (words) comprising the information element.
13. Location. Enter the left-most position of the record which contains the information element description.

Record Diagram

There should be one record diagram for each record type. Each data item should be identified clearly and its position and length within the record given.

Subroutines Applying to Table

A complete list of all subprograms that reference this table should be maintained and printed as the last page of documentation for each table.

4 SUMMARY

A machine-independent system for table handling within EDITSPEC has been developed. This report has presented computer programmers with a description of this system, including the design concepts and the table definitions.
